归集层消息ID算法 (msgld):

18字节的Base64编码字符串(24位):

1. 服务器时间戳: 取ngx.now()*1000得到毫秒数,8位字节

2. ip地址: 取ngx.var.server_addr, 4字节

3. 工作进程号: ngx.work.pid() % 65536, 2字节 4. 连接序列号: ngx.var.connection % 65536, 2字节

5. 请求计数器: ngx.var.connecton_requests % 65536, 2字节

应用层消息体ID算法(logId):

			索引号(4字符)			
1-4	5-8	9-12	13-16	17-20	21-24	25-28

28位定长字符串:

1. 归集层消息ID: 24位字符串

2.索引号:一个归集层消息派生最多65536个应用层日志消息,每个消息分配一个从0开始的2字节索引号,2字节转为4位十六进制字符串

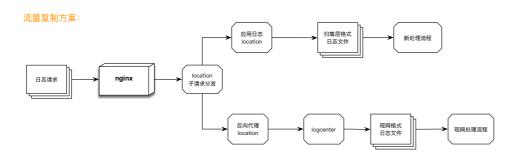

应用ID算法(appld):

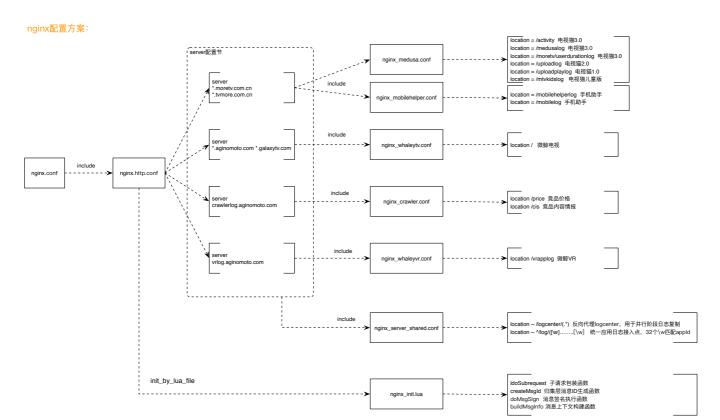

字符串合并算法:

将一个16位0-9a-f的字符串合并为8位0-9a-Z的字符串

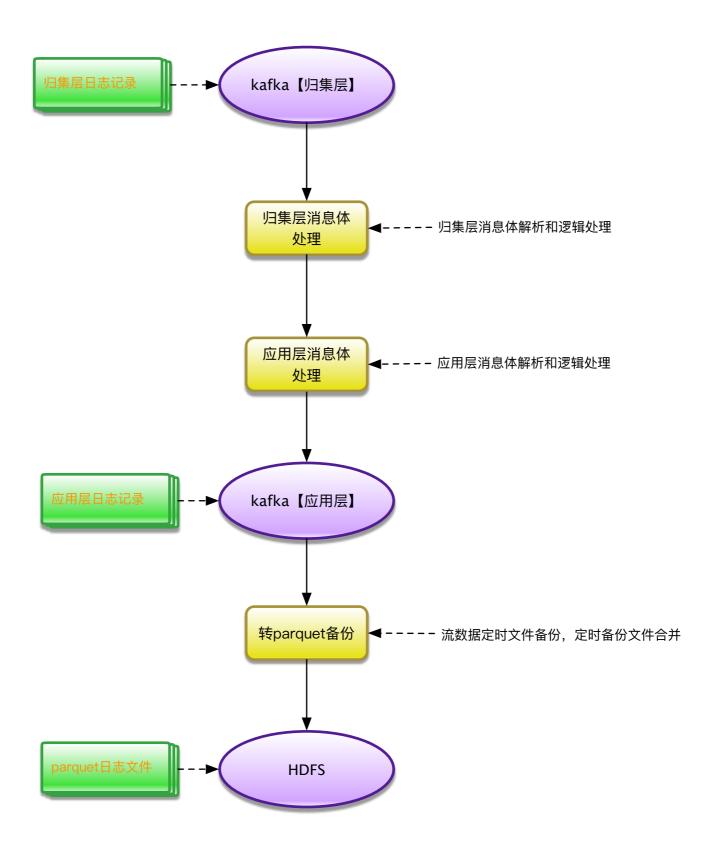

- 1. 定义字符空间A(0-9a-v),从0开始依次编号
- 2. 16位字符串的每一位映射到编号0-15, 即0-9a-f映射到0-15
- 3. 16位字符串的前后8位编号按位相加再加1, 得到8个1-31的编号
- 4. 以8个1-31的编号为下标,则字符串空间A中取对应的字符组成一个8位字符串

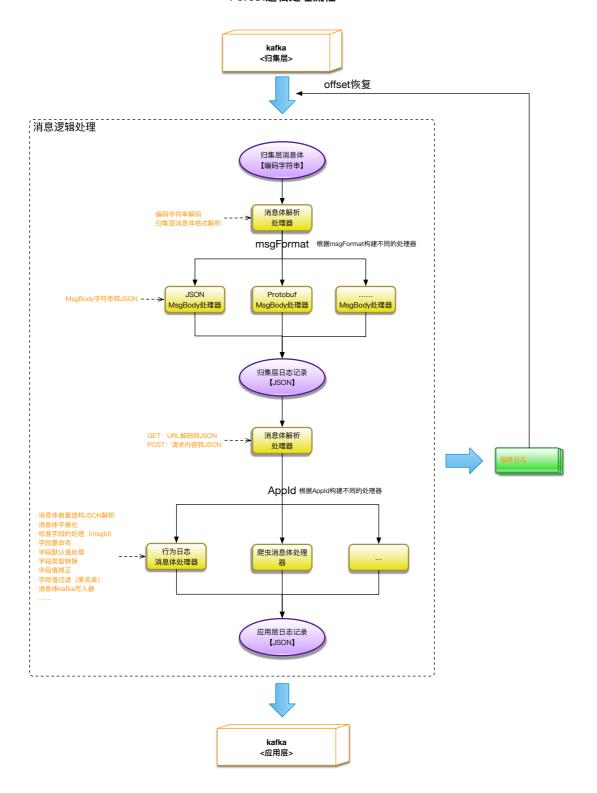

接入层规划:

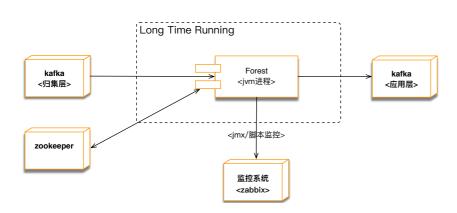

appId	公司Id	产品代码	应用代码	应用说明	点人發前目	规划接入点
